NAME

splitmail – split mailbox files prior to indexing

SYNOPSIS

splitmail -p *prefix* **[** *file* **]**

DESCRIPTION

splitmail is a utility to split a mailbox file (or standard input) comprised of multiple messages into multiple files of individual messages to facilitate indexing with **index**(1). The generated files have 5-digit increasing numbers appended to a common prefix.

OPTIONS

−p *prefix*   Specifies the common prefix.

EXAMPLE

The command:

```
splitmail -p msg sent_messages
```

splits the mailbox `sent_messages` into files named `msg.00001`, `msg.00002`, and so on.

NOTE

This utility hasn't been exhaustively tested.
